**Recommended values of standard
frequencies for applications including
the practical realization of the metre and
secondary representations of the second
Part 2: Mercury 199 Ion ()**

CCL-CCTF Frequency Standards Working Group

9th edition 2019

1. Recommended value [CCTF 22nd Meeting \(2020\)](#) of the frequency in the CIPM List of Frequencies

$$f(^{199}\text{Hg}^+) = 1\,064\,721\,609\,899\,146.96\text{ Hz}$$

equivalent to

$$\lambda(^{199}\text{Hg}^+) = 281\,568\,867.591\,968\,08\text{ fm}$$

with a relative standard uncertainty of 2.2×10^{-16} .

This radiation was endorsed by the CIPM as a secondary representation of the definition of the second.

2. Method to establish the recommended value

A global adjustment of all measurements of frequency ratios published in peer-reviewed publications and available to the CCL-CCTF WGFS was carried out following the methods presented in [3] to [7].

This adjustment determines the frequency of 14 transitions (see Figure 1, see p. 5) which are either already adopted as secondary representations of the second [7] or considered as candidates for SRS. It took into account 105 measurements, including 33 frequency ratios and 72 absolute frequency measurements (i.e. ratios to the ^{133}Cs frequency). A total of 483 correlations between these input measurements were estimated and considered in the adjustment. More details on the input data and the processing are provided at https://webtai.bipm.org/ftp/pub/tai/publication/wgfs/Adjustment_2021.html. The recommended value is the direct result of the adjustment, rounded as deemed adequate with respect to the recommended uncertainty.

While the results are from a global adjustment, it is of interest to note (see Figure 1, see p. 5) that the $^{199}\text{Hg}^+$ transition is involved in 1 measurement relative to ^{133}Cs , and in 1 frequency ratio with an optical transition.

Figure 1 — Representation of the 105 measurements linking 14 transitions on the circle and ^{133}Cs at the center.

$^{199}\text{Hg}^+$ ion, $5d^{10}6s\ ^2S_{1/2} - 5d^96s^2\ ^2D_{5/2}$ unperturbed optical transition
