Annexe 2

## Annex 2

Valeurs recommandées des fréquences étalons destinées à la mise en pratique de la définition du mètre et aux représentations secondaires de la seconde

**Recommended values of standard frequencies for applications including the practical realization of the metre and secondary representations of the second**

Partie 2

## Part 2

Rubidium ()

**Rubidium ()**

**Recommended values of standard  
frequencies for applications including  
the practical realization of the metre and  
secondary representations of the second  
Part 2: Rubidium ()**

CCL-CCTF Frequency Standards Working Group

**9<sup>th</sup> edition      2005**

---

## 1. CIPM recommended values

The values  $f = 385\,285\,142\,375\text{ kHz}$   
 $\lambda = 778\,105\,421.23\text{ fm}$

with a relative standard uncertainty of  $1.3 \times 10^{-11}$  apply to the radiation of a laser stabilized to the centre of the twophoton transition. The values apply to a rubidium cell at a temperature below 100 °C and are corrected to zero laser power.

## 2. Source data

Adopted value  $f = 385\,285\,142\,375\,(5)\text{ kHz}$   
 $u_c/y = 1.3 \times 10^{-11}$   
 for which:  
 $\lambda = 778\,105\,421.23\,(1)\text{ fm}$   
 $u_c/y = 1.3 \times 10^{-11}$

calculated from

| $f/\text{kHz}$    | $u_c/y$                               | source data |
|-------------------|---------------------------------------|-------------|
| 385 285 142 378.3 | $5.2 \times 10^{-12}$                 | [1]         |
| 385 285 142 373.8 | $3.4 \times 10^{-12}$                 | [2]         |
| 385 285 142 372.3 | $1.4 \times 10^{-11}$                 | Section 2.1 |
| Weighted mean     | $f = 385\,285\,142\,375.0\text{ kHz}$ |             |

applies to the single-photon laser frequency of the two-photon transition. The CCL decided to attribute a standard uncertainty of 5 kHz, corresponding to a relative standard uncertainty of  $1.3 \times 10^{-11}$ .<sup>(1)</sup>

<sup>(1)</sup> A recent measurement made after the CCL 2001 has confirmed one of the data [3].

### 2.1.

Bernard et al. [4] gives

$$f\{^{87}\text{Rb}, 5S_{1/2} (F_g = 2) - 5D_{5/2} (F_e = 4)\}/2 = 385\,284\,566\,370.4\text{ kHz}$$

$$u_c/y = 5.2 \times 10^{-12}.$$

From [5] cited in Table 4,

$$f\{^{87}\text{Rb}, 5S_{1/2} (F_g = 2) - 5D_{5/2} (F_e = 4)\}/2 - f\{^{85}\text{Rb}, 5S_{1/2} (F_g = 3) - 5D_{5/2} (F_e = 5)\}/2 = -576\,002\text{ kHz}$$

$$u_c/y = 1.3 \times 10^{-11},$$

one obtains

$$f\{^{85}\text{Rb}, 5S_{1/2} (F_g = 3) - 5D_{5/2} (F_e = 5)\}/2 = 385\,285\,142\,371.40$$

$$u_c/y = 1.4 \times 10^{-11}.$$

### 3. Absolute frequency of the other transitions related to those adopted as recommended and frequency intervals between transitions and hyperfine components

These tables replace those published in BIPM Com. Cons. Long., 2001, **10**, 184-187 and *Metrologia*, 2003, **40**, 127-128.

The notation for the transitions and the components is that used in the source references. The values adopted for the frequency intervals are the weighted means of the values given in the references.

For the uncertainties, account has been taken of:

- the uncertainties given by the authors;
- the spread in the different determinations of a single component;
- the effect of any perturbing components;
- the difference between the calculated and the measured values.

In the tables,  $u_c$  represents the estimated combined standard uncertainty ( $1\sigma$ ).

When a two-photon transition is listed, the listed frequency indicates the one-photon laser frequency.

**Table 1**

| $\lambda \approx 778 \text{ nm } ^{85}\text{Rb } 5\text{S}_{1/2} - 5\text{D}_{3/2} \text{ two-photon transition}$ |                                                                                                                                   |                    |

## 4. Absolute frequency of other transitions

### 4.1. Absorbing atom $^{87}\text{Rb}$ , $5S_{1/2} (F_g = 2) - 7S_{1/2} (F_e = 2)$ two-photon transition

The values  $f = 394\,397\,384\,460\text{ kHz}$   
 $\lambda = 760\,127\,906.05\text{ fm}$

with a relative standard uncertainty of  $1.7 \times 10^{-10}$  apply to the single-photon laser frequency of the two-photon transition.

Adopted value  $f = 394\,397\,384\,460\text{ (67) kHz}$   
 $u_c/y = 1.7 \times 10^{-10}$   
 for which:  
 $\lambda = 760\,127\,906.05\text{ (.13) fm}$   
 $u_c/y = 1.7 \times 10^{-10}$

After [Refs [8], [9]]

### 4.2. Absorbing atom $^{87}\text{Rb}$ , $5S_{1/2} (F_g = 1) - 7S_{1/2} (F_e = 1)$ two-photon transition

The values  $f = 394\,400\,482\,100\text{ kHz}$   
 $\lambda = 760\,121\,936.0\text{ fm}$

with a relative standard uncertainty of  $4.5 \times 10^{-10}$  apply to the single-photon laser frequency of the two-photon transition.

Adopted value  $f = 394\,400\,482\,100\text{ (180) kHz}$   
 $u_c/y = 4.5 \times 10^{-10}$   
 for which:  
 $\lambda = 760\,121\,936.0\text{ (.34) fm}$   
 $u_c/y = 4.5 \times 10^{-10}$

After [Refs [8], [9]]

**Absorbing atom  $^{85}\text{Rb}$ ,  $5\text{S}_{1/2} (F_g = 3) - 5\text{D}_{5/2} (F_e = 5)$  two-photon transition**
